Module 2 Cheat Sheet - Introduction to Linux Commands Getting information Return your user and group id: Return operating system name, username, and other info: Display reference manual for a command: man top List available man pages, including a brief description for each command: Get help on any command (for eg: curl): curl --help This provides a brief overview of the curl command's usage and options Return the current date and time: date Navigating and working with directories Find files in directory tree that end in .sh: find -name "*.sh" Return path to present working directory: Make a new directory: mkdir new folder Change the current directory: Up one level: cd ../ To home: cd ~' or 'cd To some other directory: cd path_to_directory rmdir temp_directory -v Monitoring system performance and status List selection of/all running processes and their PIDs: ps ps -e top List mounted file systems and usage: Creating, copying, moving, and deleting files: Create an empty file or update existing file's timestamp: cp file.txt new_path/new_name.txt mv this_file.txt that_path/that_file.txt Remove a file verbosely: rm this_old_file.txt -v Working with file permissions Change/modify file permissions to 'execute' for all users: chmod u+x mv file.txt Remove 'read' permissions from group and other users: chmod go-r Displaying file and string contents cat my_shell_script.sh Display file contents page-by-page: more ReadMe.txt Display last 10 lines of file: tail -10 data_table.csv Display string or variable value:

echo "I am not a robot"
echo "I am \$USERNAME"

Basic text wrangling

Sorting lines and dropping duplicates:

Sort and display lines of file alphanumerically:

sort text_file.txt

In reverse order:

sort -r text file.txt

Drop consecutive duplicated lines and display result:

uniq list_with_duplicated_lines.txt

Displaying basic stats:

Display the count of lines, words, or characters in a file:

Lines:

wc -l table_of_data.csv

Words:

wr _w mu occau tv

Characters:

wc -m some_document.txt

Extracting lines of text containing a pattern:

Some frequently used options for grep:

Option	Description
-n	Print line numbers along with matching lines
-c	Get the count of matching lines
-1	Ignore the case of the text while matching
-v	Print all lines which do not contain the pattern
-W	Match only if the pattern matches whole words

Extract lines containing the word "hello", case insensitive and whole words only:

grep -iw hello a_bunch_of_hellos.txt

Extract lines containing the pattern "hello" from all files in the current directory ending in .txt:

grep -1 hello *.txt

Merge two or more files line-by-line, aligned as columns:

Suppose you have three files containing the first and last names of your customers, plus their phone numbers.

Use paste to align file contents into a Tab-delimited table, one row for each customer:

paste first_name.txt last_name.txt phone_number.txt

Use a comma as a delimiter instead of the default Tab delimite

paste -d "," first_name.txt last_name.txt phone_number.txt

Use the cut command to extract a column from a table-like file:

Suppose you have a text file whos rows consist of first and last names of customers, delimited by a comma.

Extract first names, line-by-line:

cut -d "," -f 1 names.csv

Extract the second to fifth characters (bytes) from each line of a file:

cut -b 2-5 my_text_file.txt

Extract the characters (bytes) from each line of a file, starting from the 10th byte to the end of the line:

cut -b 10- my_text_file.txt

Compression and archiving

Archive a set of files

tar -cvf my_archive.tar.gz file1 file2 file3

Compress a set of files:

zip my_zipped_files.zip file1 file2 zip my_zipped_folders.zip directory1 directory2

Extract files from a compressed zip archive:

unzip my_zipped_file.zip unzip my_zipped_file.zip -d extract_to_this_direcory

Working with networking commands

Print hostname

hostname

Send packets to URL and print response:

ping www.google.com

Display or configure system network interfaces:

ifconfig ip

Display contents of file at a URL:

curl <url>

Download file from a URL:

wget <url>
